Digital CrimeScene™ allows you to easily record and accurately document crime scenes with digital security. Corrupted photographs are a thing of the past.

Digital CrimeScene™ is a complete system designed specifically for crime scene management. Now you can securely store forensic data, images, photos, reports, documents, drawings, and even narratives for all of your cases. Photographs are archived to CD-ROM and SQL database as they are entered into the system and then cataloged for retrieval and printing. Both media serve as “Electronic Negatives” that will never allow the original to be altered.

DIGITAL CRIMESCENE™: ALWAYS SAY “YES”
TO THE COURTROOM QUESTION, “IS THIS A TRUE
AND ACCURATE REPRESENTATION?”

Digital CrimeScene™ includes an automated workflow manager that allows cases or specific data to be routed to and reviewed by supervisors or selected individuals. This ensures that every case is reviewed as needed.

Digital CrimeScene™ utilizes the power and security of Microsoft Windows and SQL Server in virtually any networking scheme to provide real-time access to photos and case information to authorized users. Internet Explorer (v. 6.0 and later) gives access to authorized users throughout the enterprise network.

The system is ideal for a multi-departmental or multi-agency central services application. Data can be selectively shared with other agencies including the courts and prosecutors’ offices. This eliminates special printing requests, travel, and manpower to select and separate what others can access and view. This generally creates enough savings to justify purchase and use of Digital CrimeScene™ in just one year.

Secure Evidence:

Electronic Negatives	Photos are saved to the SQL database as they are processed. Original images are <i>NEVER</i> altered, assuring positive in-court validation.
System Security	Individual login IDs & activity tracking let you know who has viewed or worked with a case.
Image Security	Secure image capture and storage prevents court challenges directed at alterations. Image verification is also provided using a hash validation system.
Reliable	Industry standard hardware is reliable & cost-effective to maintain. The system hardware is built on standard Microsoft technology. System reliability is maintained using workstation options such as disk mirroring & other hardware redundancy options.

Search and Retrieve:

Quick	Offers the fastest image retrieval and display available today for on-screen review and revision of displays and search criteria.
View Images	Thumbnail and larger images are viewable with a mouse click and portions can be zoomed in for closer viewing.
Image Comparison, Composites, & Calibration	Image comparison allows the user to view images side-by-side as well as make edits to copies of the images for easier viewing or to clarify certain details. Users can overlay two images to view distinct differences. Images can also be calibrated for evidence comparisons.

System Technology:

Server	Central Microsoft SQL Server allows for sharing, data back-up, secure data access, & disaster recovery.
Third Party Application Interface	Interface with third party graphic image editors. Edited images never replace the original image, but are added to the case as an enhancement of the image.
Standards Compliance	Images are compressed using industry standard JPEG compression.
Reliable Networking	True client/server with advanced WAN/LAN functionality.

Customize:

Create your own descriptive database. The inquiry database can track the descriptive data entered when generating incident, evidence or reviews.

Include real-time interactive case feedback

Create multiple databases.
